(Received: February 27, 2009. Accepted: May 11, 2009)

**ABSTRACT.** The study presents results of investigations conducted in the years 2005-2008 on protected, rare and endangered plants in the interfluvium of the Śłupia and Wieprza rivers. A total of 132 species of vascular plants, belonging to 56 families, were recorded in the investigated area. These included 95 apophytes, 15 archeophytes, eight kenophytes and 14 ergasiophytes. A total of 64 species covered by legal protection were reported, e.g.: *Baeothryon cespitosum*, *Chimaphila umbellata*, *Drosera anglica*, *D. intermedia*, *D. rotundifolia*, *Epipactis atrorubens*, *E. palustris*, *Erica tetralix*, *Goodyera repens*, *Linnaea borealis*, *Myrica gale*, *Neottia nidus-avis*, *Nymphaea candida*, *Pedicularis palustris*, *Platanthera bifolia*. The presence of *Dianthus superbus*, *Lunaria rediviva*, *Platanthera chlorantha* and *Rubus chamaemorus* was recorded, i.e. species considered critically endangered in the Pomorze Gdańskie and Pomorze Zachodnie regions.

KEY WORDS: vascular flora, Sławno Upland, Śłupia river, Wieprza river, ATPOL

## INTRODUCTION

Flora of vascular plants in the interfluvium of the Śłupia and Wieprza rivers (the eastern part of the Sławno Upland province) has not been the object of comprehensive studies yet. The oldest reports were published by Reverend Homann (1828-1835), who in a 3-volume monograph wrote on certain species found in that region Kobylnica (*Kublitz*), Nosalin (*Nitzlin*), Ślupsk (*Stolp*), Sycewice (*Zitzewitz*) and river valleys Moszczeniczka (*Motz Bach*) and Zielona Struga (*Feuer Bach*). Several years later SCHMIDT (1848) published a list of species for the Pomerania region, among which he mentioned several taxa from the Starokrakowskie Forests (*Forst Alt Krakow*). Information on rare plants from the area Przysztawy (*Pirbstow*), Sławno (*Schlawe*), Słowno (*Schlawin*) and Zębowo (*Symbow*) was given by MÜLLER (1898). Floristic data from e.g. the Sławno and Ślupsk counties were published in a study by LEICK (1925) and concerned peatbogs, forest and ruderal communities. In the 1920's and 1930's materials collected during botanical field trips in the area Sławno (HASSE 1924, HOLZFUß 1925, MARQUARDT 1929, 1930, ROSENOW 1930) were published. A summary of findings by naturalists from Sławno was given in a publication by MARQUARDT (1948), which presented numerous floristic data from the Sławieński Forest (*Schlauer Stadtwald*) and valleys of Rivers: Jesienica (*Esch Bach*), Moszczenica (*Motze*), Reknica (*Krebs Bach*), Tokara (*Taukaree*) i Wieprza (*Wipper*). In Ślupsk (*Stolp*) investigations on vascular, particularly synanthropic flora were conducted starting from 1920's by German researchers, KARL (1925),

BANNIER (1929), OTTE (1933). For the area of the former Ślupsk county (*Kreis Stolp*) localities of rare plants were reported e.g. by BANNIER (1933), KRAUSE (1934). In the period following World War II publications were printed concerning the chorology of vascular plants in the area of Ślupsk and its environs, e.g. MODRZEJEWSKI (1958), MISIEWICZ (1987), MISIEWICZ et al. (1993), SOBISZ (2002).

In the area of the study in the 1930's a botanical garden was established in Sławno at the former Progimnasium school, in the creation of which adjacent meadows (*Kuhbruch*), the Municipal Canal (*Młynek*) (*Holz Graben*) and three ponds neighbouring the railway tracks of the Gdańsk (Danzig) – Szczecin (Stettin) line were used. The garden was created by Karl Friedrich Marquardt, the head of the department of botany and zoology of the Regional Museum at Darłowo (ROSENOW 1986). This garden was described by e.g. HOFFMAN (1951), FIGLAROWICZ (1960), STECKI and BIERNACKI (1961), SOBISZ et al. (2003). At present in the former garden the remaining elements include fragments of the rock garden, a destroyed section of geophytes and plots of ornamental plants. In 2001 the School Nature Refuge was established on the site.

Valuable floristic data (based mainly on data reported by German researchers) from the Pomerania region were supplied by a study by CZUBIŃSKI (1950), which presented the wealth of the Pomeranian flora in view of climatic, orographic, soil and water relation conditions.

The interfluvium of the Śłupia and Wieprza after World War II was also the object of investigations for Polish specialists in floristics. Peatbog flora of that area was

studied by CZUBIŃSKI (1949); KRÓL (1968, 1969). Investigations on the flora and segetal and ruderal vegetation were conducted by BOROWIEC et al. (1977 a, b), MISIEWICZ (1978), MISIEWICZ and SOBISZ (1987), ROLA and KUCHARCZYK (1992), SOBISZ (1996), ROLA et al. (2001). The dendroflora and herbaceous flora of manor parks were described by KOWNAS and SIENICKA (1965), PACYNIAK and SURMIŃSKI (1965), SENETA (1979), MAJEWSKI (1981), MISIEWICZ and GRODZKA (1994), SOBISZ and TRUCHAN (2005), SOBISZ (2008). Detailed studies at archeological excavation sites were carried out by WITT (1934) and CELKA (2002).

Herbarium materials supply essential information on the flora of the region from which they come. The oldest preserved herbarium from the area of the study includes a collection of poisonous plants from the environs of Kobylnica and Lubuń (HOMANN 1811). Interesting herbarium collections were created for Sławno in the years 1933-1934 (CELKA et al. 2003). Herbarium materials of outstanding value are deposited at the Museum at Darłowo, which survived World War II. Over 1100 alleges originating from the area of Sławno and Słupsk were preserved (MISIEWICZ 1977). At present this herbarium is found at the Herbarium SLTC of the Institute of Biology and Nature Protection, the Pomeranian University in Słupsk.

Former herbarium collections containing very rare species and a lack of a current study on the vegetation cover were an inspiration for the decision to undertake investigations in that area.

#### THE AREA OF STUDY

According to the geo-physical regionalization the interfluve of the Słupia and Wieprza rivers belongs to the Sławno Upland mesoregion (KONDRAKCI 1994). According to the geobotanical division SZAFAER (1972) the investigated area is located within the following regions: the Baltic Coastland and Pomeranian Lake District of the Wałcz-Drawsko district, while according to SZAFAER (1972) it is in the Southern Baltic Coastland region of the Słupsk district and the Central Pomeranian Lake Districts regions of the Bytów district, the Drawsko Lake District.

In terms of the administrative division the area belongs to the Sławno and Słupsk counties and the communes of Dębica Kaszubska, Kobylnica, Sławno, Słupsk and Ustka.

Forest complexes are administered by three Forest Divisions:

- Leśny Dwór (NLD) – the Skarszów district (forest districts (L.) of Lubuń and Płaszewko),
- Sławno (NS) – the Stary Kraków district (forest districts (L.) of Chudaczewko, Emilianowo, Krakowiany, Pątnowo, Radosław and Wrześnica) – the Żukowo district (forest districts (L.) of Janiewice, Łętowo, Ostrowiec and Tychowo),
- Ustka (NU) – the Słupsk district (forest districts (L.) of Machowino, Sycewice and Zębowo) – the Ustka district (forest districts (L.) of Redwanki, Peplino and Starkowo).

The relief of the eastern part of the Sławno Upland is rather monotonous and it reaches altitudes of 40-60 m a.s.l. The diversification of surface features increases in the southerly direction. A considerable proportion of the analysed area is covered by bottom moraine plateau forms, i.e. upland plain and undulating morainic plateau, which at the boundary with the channel of the Reknica river turns into a hilly plateau. The upland plain (with relative heights of up to 2 m) is located in the northern part of the mesoregion from the line established by Rzyszczewo – Bobrowice – Warszko-wo – Wrześnica – Zębowo – Strzelino. The undulating morainic plateau (relative heights of 2-5 m) is situated south of the above mentioned line. Flat or undulating plateau surfaces are broken by the valleys of the Słupia and the Wieprza as well as their tributaries and subglacial channels and erosion valleys. The most important tributaries of the Słupia in the analysed area include the Sycewice watercourse and Gnilna, Głaźna, Kamienna and Kwacza in turn, in the Wieprza catchment there are Jesienica, Moszczenica, Moszczeniczka, Pijawica, Reknica, Radosławka, Ściegnica and Zielona Struga (CYBERSKI 1984, FLOREK 1991).

In terms of the soil and agricultural regionalization the investigated area belongs to the Koszalin-Słupsk Region (MROZOWSKI 1974). In the discussed Region leached brown soils and pseudopodsolic soils predominate (74.6%), formed from unformed light loams, on a more cohesive subsoil of loose and slightly loamy sands. Brown soils formed from light and medium loams occupy a very small area (4.6%). A very limited percentage of these soils is formed from silty soils and clays rich in calcium carbonate (1.3%) and is found in Pleistocene marginal lakes in the area of villages Pieszcz – Kłośnik – Postomino and west of Sławno (surroundings of the villages Boleszewo – Sławsko – Staniewice – Rzyszcze-wo). Peat soils, alluvial muck soils and muck soils were formed in river valleys (10.7%). Next to them, small areas are covered by black earths (7.3%) and alluvial soils (2.8%) (CHABROWSKI et al. 1980).

In terms of climatic conditions the eastern part of the Sławno Upland belongs to the East-Central Seaside region, the Jarosławiec-Łeba subregion and the North Pomeranian region (Woś 1970). A certain diversification may be observed here between lower and middle vs. upper courses of the Słupia and Wieprza rivers. The highest total annual precipitation (over 775 mm) is reported for the upper, while the lowest – for the lower section of the catchment (700 mm). The highest rainfall is recorded in July, while the lowest in March. The mean number of days of snow-lying ranges from 46 in the lower to 72 in the upper course of both rivers (KOŚIŃSKI 1995).

The area of the Słupia and Wieprza interfluve is a distinctly agricultural region and in the most part it is deforested. Preserved archeological microregions and settlement complexes with a chronological sequence from the Neolithic Age through the Lusatian-Pomeranian and Oksywie-Wielbarski periods to the early Middle Age territorial communities indicate a long-term land use in the Słupia and Wieprza interfluve ŁOSIŃSKI 1982, FLOREK 1989, OLĘDZIAK and SIUCHNIŃSKI 1989, RĄCZKOWSKI 1989). The region around Sławno and Słupsk since the early Middle Ages has been known as

a separate settlement complex. It clustered on plains and fertile areas of the bottom morain, with advantageous conditions for soil cultivation and animal breeding. In the interfluviae of the Słupia and the Wieprza we may find several ruins of fortified towns dating back to the 9th-10th centuries. Lowland hollow fortified settlements predominating in the agricultural landscape include (ŚLASKI 1962). New areas used for settlements in the Sławno-Słupsk region were created as a result of forest thinning. This process was intensified starting from the 14th century and large areas of primeval forest were transformed into fields and meadows (ŚLASKI 1951). Over the time larger forest complexes were preserved mainly between Chudaczewko and Pątnów, Staniewice and Wrześnica, and between Gałęzinowo and Krzemienica.

## MATERIAL AND METHODS

Studies on vascular flora in the interfluviae of the Słupia and Wieprza rivers were conducted in the years 2005-2008. The location of the area of analysis is presented in Figure 1. Nomenclature of vascular plants is consistent with a study by MIREK et al. (2002). The position of taxa in terms of their geographical-historical status, taking into consideration the unique character of this region, was defined based on lists: ZAJĄC (1979), ZAJĄC and ZAJĄC (1992) and ZAJĄC et al. (1998). Following abbreviations were used in the geographical-historical classification: Ap - apophyt, Ar - archeophyt, Erg - ergasiophyt, Ken - kenophyt, Sn - non-synanthropic spontaneophyt.

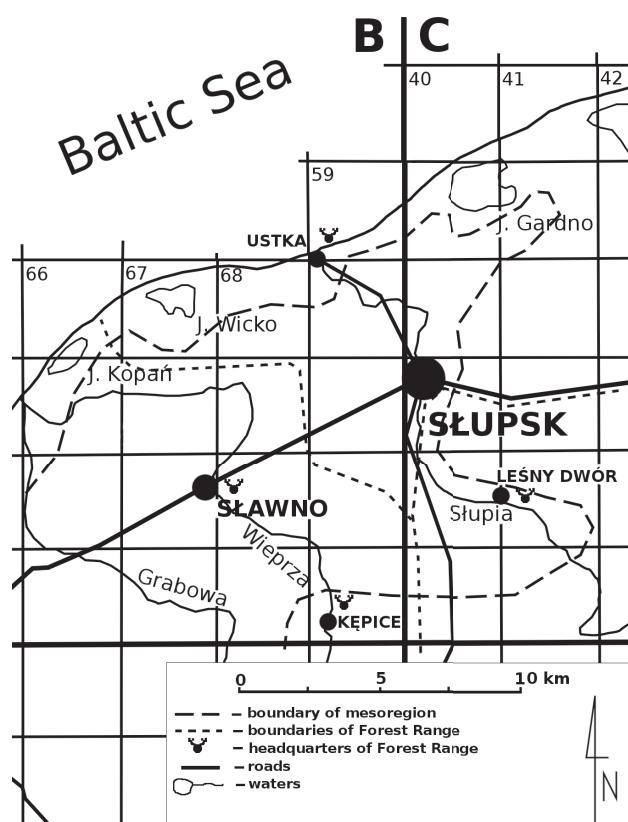

FIG. 1. Location of the study area

Species covered by legal protection are given after the Ordinance of the Minister of the Environment (ROZPORZĄDZENIE... 2004). Species covered by complete protection are denoted with !!, while those covered by partial protection - with !. Protected species, recorded in anthropogenic habitats, are marked in the table with \*. In the evaluation of the local threat for species the following categories were applied, as defined in studies by ŻUKOWSKI and JACKOWIAK (1995): R - rare, V - vulnerable, E - endangered, as well as MARKOWSKI and BULIŃSKI (2004): LC - least concern, NT - near threatened, VU - vulnerable, EN - endangered, RE - regionally extinct. Moreover, categories of threat for species found on the Red list of vascular plants in Poland are given according to ZARZYCKI and SZELĄG (2006): E - critically endangered, [E] - endangered with extinction in isolated localities, outside the main range limits, V - vulnerable, [V] - vulnerable in isolated localities, outside the main range limits. In the flora of the analysed area rare species in the region are marked with RG.

Families and species are arranged in the alphabetical order. Information on each recorded species contains the code number of the square in the ATPOL system (ZAJĄC 1978), the name of the town/village or forest district and the type of habitat/forest site. In case of forest sites the location of forest units is also given (compartments and subcompartments).

German names of towns/villages and physiographic names used after 1945 are given in brackets in italics (KAEMMERER 1988, BIAŁECKI 2001, SŁOWNIK... 2002).

## RESULTS

In the analysed area a total of 132 species of vascular plants were recorded, which are covered by legal protection, are endangered in the Pomorze Gdańskie (Gdańsk Pomerania) and Western Pomerania regions and in Poland, or are classified as rare in the region. A complete list of species is presented in Table 1. Recorded species are representatives of 56 families. Among species a total of 44 apophytes, 15 archeophytes, eight kenophytes, 51 non-synanthropic spontaneophytes and 14 ergasiophytes were reported. Localities of rare and endangered apophytes presents Figure 2, wherever localities of rare and endangered non-synanthropic spontaneophytes in the Słupia and Wieprza interfluviae presents Figure 3. Legal protection covered 64 species.

Species covered by complete legal protection and at the same time endangered in the Gdańsk Pomerania (MARKOWSKI and BULIŃSKI 2004) and the Western Pomerania (ŻUKOWSKI and JACKOWIAK 1995) in the analysed area include: *Aquilegia vulgaris*, *Baeothryon cespitosum*, *Dactylorhiza maculata*, *Drosera anglica*, *D. intermedia*, *Epipactis atrorubens*, *E. palustris*, *Erica tetralix*, *Myrica gale*, *Pedicularis palustris*, *Platanthera bifolia*, *Polemonium coeruleum*, *Scheuchzeria palustris*, *Trollius europaeus*.

Jacobs ladder (*Polemonium coeruleum*) as a vulnerable species was entered in the Polish red book of plants (RUTKOWSKI 2001). The other species covered by complete legal protection in the analysed area include: *Arum maculatum*, *Campanula latifolia*, *Carex limosa*,

* <i>Matteuccia struthiopteris</i> (L.) Tod.	Erg	!!	NT	V			BA 87 – Sawno, former Botanical Garden

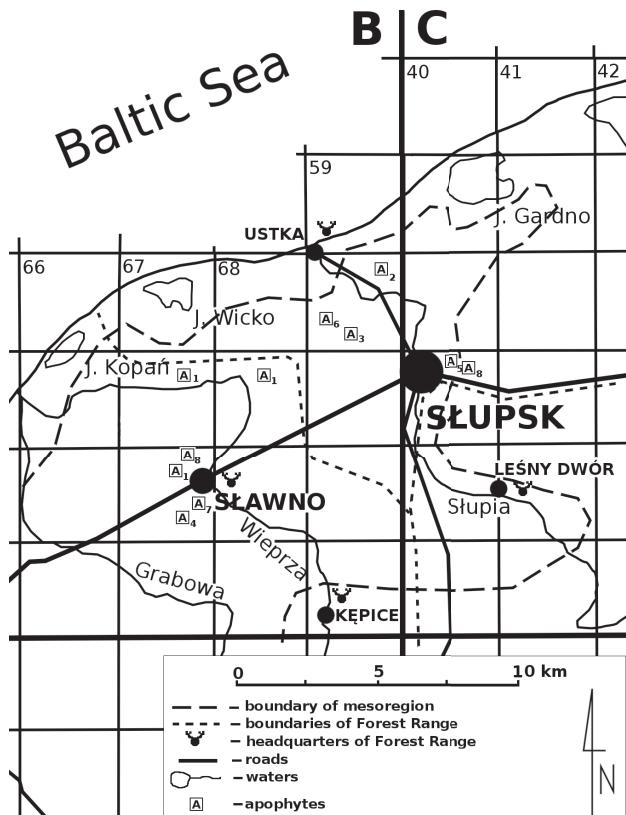

FIG. 2. Localities of rare and endangered apophytes in the Słupia and Wieprza interfluve; A1 – *Allium ursinum*, A2 – *Campanula latifolia*, A3 – *Chimaphila umbellata*, A4 – *Corydalis solidia*, A5 – *Cymbalaria muralis*, A6 – *Epipactis atrorubens*, A7 – *Euphorbia palustris*, A8 – *Polemonium coeruleum*

*Chimaphila umbellata*, *Dactylorhiza fuchsii*, *D. majalis*, *Daphne mezereum*, *Dianthus superbus*, *Digitalis grandiflora*, *Drosera rotundifolia*, *Epipactis helleborine*, *Galanthus nivalis*, *Goodyera repens*, *Hepatica nobilis*, *Ledum palustre*, *Leucoium vernum*, *Lilium martagon*, *Linnaea borealis*, *Lonicera periclymenum*, *Listera ovata*, *Lycopodium annotinum*, *L. clavatum*, *Matteuccia struthiopteris*, *Neottia nidus-avis*, *Nymphaea candida*, *Ornithogallum umbellatum*, *Platanthera chlorantha*, *Polypodium vulgare*, *Rosa gallica*, *Rubus chamaemorus*, *Sorbus intermedia*, *Taxus baccata*, *Utricularia vulgaris*. Five of them are entered in the Polish red book of plants, i.e. *Arum maculatum* (DAJDOK and KĄCKI 2001), *Carex limosa* (KUCHARSKI 2001), *Nymphaea candida* (KŁOSOWSKI 2001), *Rosa gallica* (ZIELIŃSKI 2001), *Taxus baccata* (KRUSZELNICKI 2001).

Species not covered by legal protection and critically endangered both in the Pomorze Gdańskie and the Western Pomerania regions include *Populus nigra* and *Pyrola rotundifolia*.

Species covered by partial protection and recorded in the analysed area include *Allium ursinum*, *Asarum europaeum*, *Carex arenaria*, *Convallaria majalis*, *Frangula alnus*, *Galium odoratum*, *Hedera helix*, *Helichrysum arenarium*, *Menyanthes trifoliata*, *Nuphar lutea*, *Nymphaea alba*, *Ononis arvensis*, *O. spinosa*, *Primula veris*, *Ribes nigrum*, *Viburnum opulus*, *Vinca minor*. Bear's garlic (*Allium ursinum*) is at the same time an endangered species in the Gdańsk Pomerania and Western Pomerania regions.

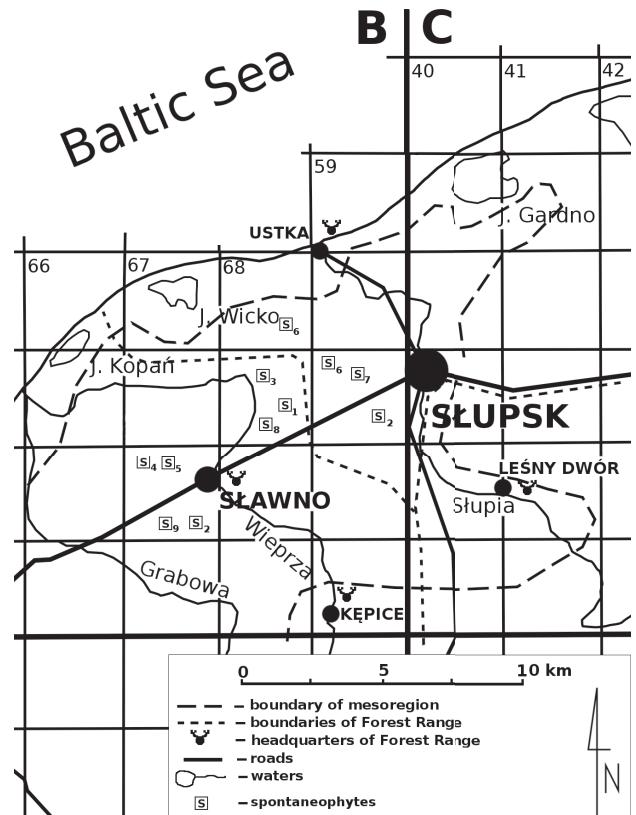

FIG. 3. Localities of rare and endangered non-synanthrophic spontaneophytes in the Słupia and Wieprza interfluve; S1 – *Corydalis cava*, S2 – *Daphne mezereum*, S3 – *Dianthus superbus*, S4 – *Drosera anglica*, S5 – *Drosera intermedia*, S6 – *Myrica gale*, S7 – *Nymphaea candida*, S8 – *Platanthera chlorantha*, S9 – *Rubus chamaemorus*

Among 132 species included in this study, 25 are found in the Polish red list of plants (ZARZYCKI and SZELĄG 2006): *Allium ursinum*, *Arum maculatum*, *Baeothryon cespitosum*, *Bromus secalinus*, *Campanula latifolia*, *Carex limosa*, *Dactylorhiza fuchsii*, *D. maculata*, *Dianthus superbus*, *Drosera anglica*, *D. intermedia*, *D. rotundifolia*, *Dryopteris cristata*, *Epipactis palustris*, *Erica tetralix*, *Euphorbia palustris*, *Goodyera repens*, *Leucoium vernum*, *Myosurus minimus*, *Myrica gale*, *Pedicularis palustris*, *Radiola linoides*, *Rosa gallica*, *Rubus chamaemorus*, *Scheuchzeria palustris*.

Species legally protected and rare in the interfluve of the Słupia and Wieprza rivers include: *Baeothryon cespitosum*, *Campanula latifolia*, *Chimaphila umbellata*, *Dactylorhiza fuchsii*, *Dianthus superbus*, *Digitalis grandiflora*, *Drosera anglica*, *D. intermedia*, *Epipactis atrorubens*, *Linnaea borealis*, *Nymphaea candida*, *Ononis arvensis*, *Platanthera chlorantha*, *Polemonium coeruleum*, *Primula veris*, *Rubus chamaemorus*, *Trollius europaeus*.

Species not covered by legal protection and rare in the investigated region include: *Achillea ptarmica*, *Actaea spicata*, *Aethusa cynapium*, *Agrostemma githago*, *Alchemilla monticola*, *Alnus incana*, *Anthemis tinctoria*, *Anthoxanthum aristatum*, *Arabis glabra*, *Barbarea vulgaris*, *Bunias orientalis*, *Carex flacca*, *Carlina vulgaris*, *Chaenorhinum minus*, *Chenopodium glaucum*, *Centaurea stoebe*, *Conium maculatum*, *Consolida regalis*, *Corispermum leptopterum*, *Corydalis cava*, *C. solidia*, *Cuscuta europaea*, *Cymbalaria muralis*, *Digitaria sanguinalis*,

*Diplotaxis muralis*, *Echinops sphaerocephalus*, *Euphorbia esula*, *E. palustris*, *Filago arvensis*, *Galeopsis ladanum*, *Geranium dissectum*, *Hypochoeris gabra*, *Lathyrus tuberosus*, *Lunaria rediviva*, *Medicago minima*, *Melandrium noctiflorum*, *Myosurus minimus*, *Nepeta cataria*, *Odonites verna*, *Ornithopus perpusillus*, *Parnassia palustris*, *Pyrola minor*, *Radiola linoides*, *Ribes alpinum*, *Sanicula europaea*, *Scorzonera humilis*, *Sherardia arvensis*, *Thlaspi perfoliatum*, *Utricularia vulgaris*, *Valerianella locusta*, *Veronica polita*, *Vicia grandiflora*, *V. lathyroides*, *V. tetrasperma*, *Viola mirabilis*.

Among species not covered by legal protection and rare in the interflue of the Słupia and Wieprza rivers the following are endangered in the Pomorze Gdańskie region: *Chaenorhinum minus*, *Cuscuta europaea*, *Hypochoeris gabra*, *Medicago minima*, *Nepeta cataria*. In turn, species such as *Actaea spicata*, *Conium maculatum*, *Radiola linoides* are endangered both in the Gdańsk Pomerania and Western Pomerania regions.

In the area of analysis four species, considered critically endangered both in the Gdańsk Pomerania and Western Pomerania, were reported, i.e. *Dianthus superbus*, *Lunaria rediviva*, *Platanthera chlorantha* and *Rubus chamaemorus*. Cloudberry is at the same time a species entered in the Polish red book of plants (KRUSZELNICKI and FABISZEWSKI 2001). It is also a species entered in the Polish red list of plants as a critically endangered species. The locality of *Rubus chamaemorus* reported in this study is new for Poland.

*Euphorbia palustris* recorded in the course of this study, is an extinct species in the Gdańsk Pomerania region (MARKOWSKI and BULIŃSKI 2004) and it is critically endangered in the Western Pomerania (ŻUKOWSKI and JACKOWIAK 1995).

Despite an intensive search, we did not find numerous species previously found in the investigated area, reported in German literature on the subject and collected in old herbaria. They are *Campanula cervicaria*, *Crepis praemorsa*, *Laserpitium prutenicum*, *Luzula sylvatica*, *Peplis portula*, *Thesium linophyllum* (MÜLLER 1898); *Carex pulicaris*, *Saxifraga hirculus* (MÜLLER 1898, DARŁOWO DEPOSIT 1897-1943); *Epipogium aphyllum* (BANNIER 1933); *Blechnum spicant*, *Huperzia selago* (BANNIER 1933, DARŁOWO DEPOSIT 1897-1943); *Camelina sativa*, *Euphorbia virgata*, *Oreopteris limbosperma*, *Setaria verticillata*, *Triglochin maritimum*, *Valerianella dentata*, *Veronica catenata* (DARŁOWO DEPOSIT 1897-1943).

Localities of protected, rare and endanger plants, reported in the years 2005-2008, most probably will disappear in the future. This will undoubtedly be caused by the observed, systematically intensified degradation of habitats. Particularly vulnerable species will be those plants, which are sensitive to fluctuations in groundwater levels, i.e. plants of moist biotopes, peatbogs, meadow moors, and aquatic plants. Thus, it is recommended to protect habitats of endangered species and provide their permanent or frequent monitoring.
