(Received: July 20, 2016. Accepted: September 12, 2016)

ABSTRACT. The work presents information about the range, occurrence conditions, geographical and historical status and dynamic tendencies of *Melilotus wolgica* in Eurasia and Poland. In Poland, the species was noted for the first time in Szczecin at the end of 19th century. Later, it was observed in the anthropogenic localities in the Opole Province, Kraków and Warszawa. In Wielkopolska, *M. wolgica* was observed for the first time in 2012, south of Gosławice (Konin district), where a large population was found on the embankment of a coal ash storage reservoir of the Konin Power Plant in the former brown coal mine area.

KEY WORDS: *Melilotus wolgica*, geographical range, geographical and historical status, occurrence conditions, Eurasia, Poland, Wielkopolska

INTRODUCTION

In Europe, the genus *Melilotus* Miller (Fabaceae) is represented by 16 species (HANSEN 1968). In Poland, eight species were noted so far. Four of them: *Melilotus alba* Medik., *M. altissima* Thuill., *M. dentata* (Waldst. & Kit.) Pers. and *M. officinalis* (L.) Pall. are considered native species (MIREK et al. 2002).

Melilotus wolgica Poir. in Lam. is a Pontic species. Its natural range comprises eastern Ukraine, southern part of European Russia, up to western part of Kazakhstan. It rarely occurs in the northern part of Central and Western Europe as an adventive species. In Poland, it was noted so far in 10 localities (TRZCIŃSKA-TACIK 1967) and regarded as ephemero-phyte (ROSTAŃSKI & SOWA 1986–1987) or kenophyte (TOKARSKA-GUZIK 2005).

The main aim of this article was to characterise the occurrence conditions and size of *Melilotus wolgica* population in the locality Gosławice near Konin, as well as to try to make a preliminary diagnosis of the studied population stability. Also, the current state of knowledge about the environmental conditions, ways of spread, dynamic tendencies and distribution of *Melilotus wolgica* in Eurasia and Poland was presented.

METHODS

In the years 2010–2012, the intensive floristic investigations were conducted using field mapping technique. They covered all types of habitats, including anthropogenic, contained within 1-km grid squares made according to the ATPOL system (ZAJĄC 1978). The basis of documentation of floristic relationships were floristic and ecological relevés. In cases justified by the need of defining plant communities, phytosociological relevés were made according to the Braun-Blanquet method (PAWŁOWSKI 1977). Precise location of patches with *M. wolgica* was determined by GPS using the WGS 84 datum. The nomenclature of taxa (genera and species) was adopted after MIREK et al. (2002), while for syntaxa after MATUSZKIEWICZ (2001).

The collected specimens of *M. wolgica* were deposited in the Herbarium of Adam Mickiewicz University in Poznań (POZ).

RESULTS

Due to morphological similarity, *Melilotus wolgica* can be confused with *M. alba*. However, in *M. wolgica*, white flowers are slightly smaller and hang from a much longer pedicel than in *M. alba* (Table 1, Figs 1–3).

Table 1. Comparison of diagnostic features of *Melilotus wolgica* and *M. alba*

Diagnostic feature	<i>Melilotus wolgica</i> Poir. in Lam.	<i>Melilotus alba</i> Medik.
Flower length (mm)	3–3.5	4–5
Pedicel length (mm)	3–4 (pliable, drooping)	1–1.5 (stiff, erect)
Pod length (mm)	4.5–5	3–3.5
Pod colour	yellow-brown	blackish

According to BOBROV (1939) and DZYUBENKO & DZYUBENKO (2004), the compact range of *M. wolgica* comprises eastern Europe and western part of Asia: from the Azov Sea in the west to the upper and middle Irtysh river basin. In the southern part of the range, along the Volga River valley, it reaches the Caspian Sea (Fig. 4). *Melilotus wolgica* is a native species in the eastern Ukraine, south-west Russia and western part of Kazakhstan. Within its natural range, it grows in steppes (also saline), on gravel/sand river cliffs, in wet and saline grasslands, on fallows, baulks and even in crop fields as a segetal weed.

In central and western Europe, the species was sporadically noted at the end of the 19th century (WITTE 1909, HÖCK 1910). The first records of the occurrence of *M. wolgica* in this part of Europe come from 1891 (Germany: Mannheim; HÖCK 1910) and 1890 (Sweden: Nacka-Stockholm; ARONSSON 1994) (App. 1).

In Poland, *M. wolgica* was found only in anthropogenic localities, especially, in the railway areas. For the first time, it was observed in Szczecin at the end of the 19th century (leg. Moelendorf 1889; WITTE 1909: obs. in 1885). Later, it was noted in the Opole region (MICHALAK 1971, 1976), as well as in the vicinity of Kraków and Medyka Rozrządowa (TRZCIŃSKA-TACIK 1967), and in Warszawa (SUDNIK-WÓJCIKOWSKA 1987) (App. 2, Fig. 5A).

In Wielkopolska, *M. wolgica* was observed for the first time in 2012, about 1 km south of Gosławice, near Konin. This area is dominated by anthropogenic landforms, connected with the former exploitation of brown coal. The substratum consists of mixed geological deposits. The developing local flora and vegetation include mainly adventive and xenospontaneous elements (BALCERKIEWICZ & PAWLAK 1990).

A post-mining excavation (185.1 ha in area), located in the northern part of the former brown

Fig. 1. Fragment of *Melilotus wolgica* population on the top of embankment in the vicinity of Gosławice (phot. J. CHMIEL, 12.06.2012)

Fig. 2. Inflorescence of *Melilotus wolgica* (phot. S. MIELCZAREK, 27.06.2013)

coal mine in Gosławice, has been used as a coal ash storage site since 1977. Furnace waste in the form of semi-liquid ash and gravel mixture, as well as waste from the desulphurization of exhaust gases are transported via the pipeline system. According to KASIŃSKI (2005), sedimentary ashes are highly alkaline ($\text{pH} \sim 12.0$). In the southern part of the ash storage reservoir, a small, lifeless "lazure" lake is situated. No organic, nitrate, nitrite and phosphate compounds were found in the sediments.

In the eastern part of this reservoir, *M. wolgica* grows among other ruderal species in two vegetation patches covering 290 m^2 in total:

- population 1 comprises 36 individuals which occupy an area of about 60 m^2 along an access dirt road to the top of embankment,
- population 2 consists of about 500 individuals growing on the top of embankment (build of mixed clay and loam) and covering an area of about 230 m^2 (Fig. 5B, C).

Patches with *M. wolgica* are similar to phytocoenoses of the *Melilotetum albo-officinalis* association. The common species for both types of phytocoenoses are: *Artemisia campestris*, *Melilotus alba*, *M. officinalis*, *Medicago sativa* and *M. lupulina*. The dominant species is *Calamagrostis epigejos*.

Fig. 3. Fruit of *Melilotus wolgica* (phot. S. MIELCZAREK, 27.06.2013)

In 2012, the abundant flowering and fruiting and spontaneous seeding of *M. wolgica* was noted in the locality Gosławice. These findings indicate that, possibly, the studied species can be a stable element

of flora of post-mining areas near Konin. However, to confirm this thesis, further observations are required.

DISCUSSION

Melilotus wolgica in natural habitats was recognised as a taxon that requires protection (NAUMENKO 2012, NAUMENKO et al. 2011). In Russia, this species and its habitats are protected within the following nature reserves: Galischya Gora, Rostovsky, Khopyorsky and Arkaim (TALOVINA 2011). Probably, the main factor threatening natural habitats of *M. wolgica* was conversion of steppes into agricultural fields. As a consequence, the species, within its natural range of occurrence, was frequently found in field crops and at their margins (TRZCIŃSKA-TACIK 1967).

Geographic expansion of the species proceeds distinctly in a north-west direction. Essential for its migration are communication routes: roads and railway lines. The species dispersion is not gradual and regular in time and space. Numerous observations from Western Europe show that *M. wolgica* appears erratically, in sites considerably distant from the previous localities. In the Netherlands, Belgium, Germany, Denmark, Norway and Sweden, it was noted almost exclusively in port towns, where it was brought along with imported goods. Diaspores of *M. wolgica*, which were transported with cereals, spread ephemerally in the vicinity of mills, e.g., in Nacka near Stockholm (ARONSSON 1994). Also, BARANOVA & PUZYREV (2012), who noted the species in cereal and vegetable collecting centers, indicate the possibility of the species spread with agricultural products.

All occurrences of the species observed so far in Western Europe and Scandinavia were of ephemeral character and depended on allochthonic transport of diaspores to ruderal habitats. Effectiveness of spontaneous spread of diaspores was very small due to unfavorable marine climate conditions. *Melilotus wolgica*, which was recorded in this part of Europe over 100 years ago, did not obtain there the status of a naturalized species. Also, in Central Europe, the species is regarded as mostly ephemeral (GOJDÍČOVÁ et al. 2000, PYŠEK et al. 2002).

In Eastern Europe, it is a relatively frequent and permanent element of ruderal habitat flora in the urban areas and along roads and railway tracks. However, it is not considered an expansive species (OSTAPKO et al. 2009).

According to TOKARSKA-GUZIK (2005), *M. wolgica*, within the present borders of Poland, was recorded for the first time in Szczecin in 1937 (HOLZFUSS 1937). However, the former German and Swedish sources indicate that this species has been observed in Szczecin at least 50 years earlier (leg. Moelendorf 1889; WITTE 1909: obs. in 1885). So far, it was found in 10 localities and noted most frequently in the Opole region (MICHALAK 1971, 1976, 1981). The published data about its localities are only of descriptive value and do not consider long-term perspectives of population stability. None of former localities was subsequently visited. Also, there was no attempt

made to monitor the possibility of the species spread to semi-natural habitats, as indicated by TRZCIŃSKA-TACIK (1967). In this situation, it is difficult to determine the status of the species naturalization in Poland. According to ROSTAŃSKI & SOWA (1986–1987) and MICHALAK (1981), all populations of *M. wolgica* had an ephemeral status. However, TOKARSKA-GUZIK (2005) indicated that the species deserves the kenophyte status.

The one-year study of *M. wolgica* population in the locality Gosławice is certainly not sufficient to draw conclusions about the dynamics and stability of this population. However, when taking into account the considerable size of this population, consisting of about 500 flowering, fruiting and seeding individuals, *M. wolgica* can be considered a relatively stable element of the ruderal flora of post-mining habitats in Konin region.

A common practice used in agricultural reclamation of post-mining areas is sowing of pioneer plants that are resistant to adverse habitat conditions and activate biologically dead substratum. This group of plants includes some species of the family Fabaceae (SKAWINA 1963, MOCEK-PŁOCINIĄK 2014). Although, there are no data on using *M. wolgica* in land reclamation procedures, an accidental spread of its diasporas brought with the diasporas of *M. alba* cannot be excluded. BALCERKIEWICZ & PAWLAK (1990) reported that *M. alba* was sown on the slopes and escarpments of Konin coal basin for stabilization purposes.

The spread of *M. wolgica* in the studied post-mining area may be encouraged by the abundance of nitrogen-poor clayish and sandy formations, unfavorable for the spread of other species.

CONCLUSIONS

Melilotus wolgica originates from the steppe areas of eastern Ukraine, south-west Russia and western Kazakhstan. It spreads mainly in the north-west direction, through overland routes and sea transportation. The species was brought into the port towns of West and North Europe together with cereals as early as in the 19th century. In East Europe, apart from natural habitats, it occupies anthropogenic habitats along transportation routes.

In Poland, *M. wolgica* has been observed in 10 localities thus far (mainly in the Opole region). A large population of this species discovered in the locality near Gosławice in 2012 is the first one reported from Wielkopolska. It occupies an area of 290 m² in the eastern part of a coal ash storage reservoir of the Konin Power Plant. The species is a component of the ruderal community *Melilotetum albo-officinalis*. An abundant flowering, fruiting and seeding make it possible to recognize it as a relatively stable element of the flora of Wielkopolska.

Presumably, *M. wolgica* was brought into this area together with the seeds of *M. alba*, which were used for the stabilization of slopes and escarpments in the Konin coal basin.

ACKNOWLEDGEMENTS

I warmly thank Prof. Karol Latowski from the Adam Mickiewicz University in Poznań and Dr Maksim Dzhus from the Belarus State University in Minsk for their kind help in the verification of localities from the area of Ukraine and Belarus.

APPENDIX 1

COMPILED DATA ON THE OCCURRENCE OF *MELILOTUS WOLGICA* IN EURASIA

KAZAKHSTAN

1. Korgalzhyn state nature reserve, Akmola Region (SIDOROVA 2006, 2007)
2. W part of Kokshetau District, Akmola Region, clayish escarpments of river banks, valleys of steppe rivers (TALOVINA & SMEKALOVA 2005, after BOBROV 1945)
3. Atbasar District, Akmola Region, clayish escarpments of river banks, valleys of steppe rivers (TALOVINA & SMEKALOVA 2005, after BOBROV 1945)
4. N part of Kostanay Region, right bank of the Tobol river (NAUMENKO 2012)
5. Naursum state nature reserve, Kostanay Region (BRAGINA et al. 2007)
6. Uralsk, West Kazakhstan Region (SCHULZ 1901).

RUSSIA

7. Arkhangelsk (SCHULZ 1901, BOBROV 1945)
8. Kuznetsk, Penza Oblast (BOBROV 1945)
9. Khvalynsk, Saratov Oblast (BOBROV 1945)
10. Kama, Tatarstan (BOBROV 1945)
11. Sarepta, Volgograd Oblast (SCHULZ 1901) (former Stalingrad Oblast), generally reported from the region (MAYEVSKIY 1964, TALIYEVA 1949)
12. Mikhaylovka near Medvedica river, Volgograd Oblast (SCHULZ 1901)
13. Rostov (SCHULZ 1901), generally reported from the region (STANKOV & TALIYEV 1949)
14. Rostov reserve, Rostov Oblast (TALOVINA 2011)
15. Tundutovo, Kalmykiya Republik (SCHULZ 1901)
16. Voronezh, recognized as a kenophyte or ephemeral (MAYEVSKIY 1964)
17. Podgorensky, Bogucharsky, Nowokhopyorsky, Povorinsky District, Voronezh Oblast (AGAFONOV 2004)
18. Khropyorsky reserve, Borisoglebsk District, Voronezh Oblast (TALOVINA 2011)
19. Borisoglebsk, Voronezh Oblast, by the town's exit road towards west (ROZUMOVA & AGAFONOV 2012, obs. Rozumova, 10.08.2010)

20. Galischya Gora reserve, Zadonsky District, Lipetsk Oblast (TALOVINA 2011)
21. Tver, Doroshikha railway station (NEVSKIY 1947–1952, leg. A.A. Notov, 11.09.2004, TVBG)
22. Savelovo, Sonkovsky District, Tver Oblast, observed at the railway station in the second half of the 1970s (NOTOV 2009, after MALYSHEVA 1979)
23. Rzhev, Rzhevsky District, Tver Oblast, observed at the railway station in the second half of the 1970s (NOTOV 2009, after MALYSHEVA 1979, obs. 18.07.1978)
24. Kuvshinovo, Kuvshinovsky District, Tver Oblast, observed at the railway station in the second half of the 1970s (NOTOV 2009, after MALYSHEVA 1979)
25. Bologoye, Bologovsky District, Tver Oblast, observed at the railway station in the second half of the 1970s (NOTOV 2009, after MALYSHEVA 1979)
26. Neliidovo, Neliidovsky District, Tver Oblast, observed at the railway station in the second half of the 1970s (NOTOV 2009, after MALYSHEVA 1979)
27. Toropets, Toropetsky District, Tver Oblast, observed at the railway station in the second half of the 1970s (NOTOV 2009, after MALYSHEVA 1979)
28. Sandovo, Sandovsky District, Tver Oblast, observed at the railway station in the second half of the 1970s (NOTOV 2009, after MALYSHEVA 1979, obs. 20.08.1979)
29. Redkino, Konakovsky District, Tver Oblast, observed at the railway station in 1985, herb. TVBG (NOTOV 2009, NOTOV et al. 2009)
30. Zavidovo, Konakovsky District, Tver Oblast, observed at the railway station in 1990 (NOTOV et al. 2009)
31. All regions except Baskunkhakskogo and Bogdinskogo, Astrakhan Oblast, quite rarely, disturbed fragments of vegetation (LAKTIONOV 2010), generally reported from the region (STANKOV & TALIYEV 1949)
32. Middle part of the Volga delta, Astrakhan Oblast (LOSEV et al. 1998)
33. Kovrov, Kovrovsky District, Vladimir Oblast, gravel ground at the railway station (BORISOVA 2006, obs. Borisova 2005)
34. Railway line Murom-Kovrov, Vladimir Oblast, sandy and gravel embankments and road shoulders (SEREGIN 2012, obs. Seregin 2009)
35. Murom, Muromsky District, Vladimir Oblast, sandy road shoulders R-72 (SERGIN 2012, obs. Seregin 2009)
36. Ukrainka, Bolshechernigovsky District, Samara Oblast, Rostashi river valley, *Artemisia*-grass steppe (SUKHORUKOV et al. 2013, obs. 19.08.2013)
37. Nature sanctuary of “Hole Gryzli” near the village of Koshkin, Bolshechernigovsky District, Samara Oblast (KUZOVENKO & PLAKSINA 2010)
38. Yuzhnosamarsky, Bezenchuksky District, Samara Oblast (SENATOR 2008)
39. Yekaterinovka, Bezenchuksky District, Samara Oblast (SENATOR 2008)
40. Neftogorsky District, Samara Oblast, “Domashkiny Vershiny” steppes near river Domashka (ILINA 2013, obs. 1985)
41. Syrtovoye Zawolzhe, Bolshechernigovsky District, Samara Oblast, *Artemisia*-grass steppe (SUKHORUKOV et al. 2013, obs. 2013)
42. Engels, Engelssky District, Saratov Oblast, roadside of the forest track, recognized as a kenophyte or ephemeralophyte (MULDASHEVA 2012)
43. Saratov Oblast, generally reported from natural localities (MAYEVSKIY 1964)
44. Saratov, abandoned sand excavation site at the town outskirts (photograph by BESPALOV 08.06.2013, <http://www.planarium.ru/page/image/id/207553.html>)
45. Nizhny Novgorod (Kanavinsky, Moskovsky, Sovetsky, Prioksky District), wastelands and grasslands within the urban areas (MININZON 2015)
46. Dimitrovgrad, Ulyanovsk Oblast (RAKOV et al. 2014, obs. Rakov, 22.06.2010, PVB)
47. Maynsky, Melekessky, Radishchevsky District, Ulyanovsk Oblast (RAKOV et al. 2014)
48. Ulyanovsk (BOBROV 1945, RAKOV et al. 2014), generally reported from the region (MAYEVSKIY 1964)
49. Cherdakly, Cherdaklinsky District, Ulyanovsk Oblast, railway grounds, anthropophyte (GALYSHEVA et al. 2011, RAKOV et al. 2014)
50. Sengileyevskye gory, Sengileyevsky District, Ulyanovsk Oblast, shores of the Kuybyshev Reservoir (RAKOV et al. 2013)
51. Ust’ Kulatka, Starokulatkinsky District, Ulyanovsk Oblast, Kulatka river, obs. 27.06.2007 (SAKSONOV et al. 2007)
52. Russkaya Bektyashka, Sengilevsky District, Ulyanovsk Oblast, Volga river, Kuray nature reserve, obs. 05.07.2007 (SAKSONOV et al. 2007)
53. Izhevsky, Yarsky, Glazovsky, Balezinsky, Igrinsky District, Votkinsky, Zavyalovsky, Malopurginsky, Sarapulsky, Kambarsky, Udmurt Republic, railway track, rarely road shoulders, cereal and vegetable collecting centers (BARANOVA & PUZYREV 2012)
54. Road Izhevsk-Sarapul, Zavyalovsky District, Udmurt Republic, road shoulder, obs. 22.09.2002, in 2 places (0.5 and 2.5 km E of Kamennoye) (PUZYREV 2006, BARANOVA & PUZYREV 2012)
55. Ust-Uyskoye, Tselinnoy District, border between Kurganskoy and Kustanayskoy oblastey, slopes with steppe and forest steppe on marl outcrops (NAUMENKO 2010, 2011, KULIKOV 2005)
56. Kuybyshev Oblast, generally reported from the region (STANKOV, TALIYEV 1949, MAYEVSKIY 1964, YANCHURKINA 1976)

57. Nizhny Novgorod Oblast (former Gorki Oblast), generally reported from natural localities (MAYEVSKIY 1964)
58. Belgorod Oblast, generally reported from natural localities (MAYEVSKIY 1964)
59. Veydelevsky District, Belgorod Oblast, Popov rukav nature reserve (KOLCHANOV et al. 2012)
60. Novosibirsk, brought into railway grounds (TALOVINA & SMEKALOVA 2005)
61. Barnaul, brought into railway grounds (TALOVINA & SMEKALOVA 2005)
62. Berdsk, Novosibirsk Oblast, small population, 1 km N of the Berdsk railway station (LOMONOSOVA & SUKHORUKOV 2000)
63. Tobolsk, Tyumen Oblast (BOBROV 1945)
64. Bolshaya Urtazymka River near Tselinnoje, Khaybullinsky District, Bashkiria (KULIKOV 2005)
65. Orenburg (SCHULZ 1901)
66. Orenburg reserve, Pervomaysky District, Orenburg Oblast (SHARONOVA & PLAKSINA 2006)
67. Kvarkeno, Kvarkensky District, Orenburg Oblast (KULIKOV 2005)
68. Kulma, Kvarkensky District, Orenburg Oblast (KULIKOV 2005)
69. Arkaim reserve, Bredy District, Chelyabinsk Oblast (KULIKOV 2005)
70. Novinka, Chelyabinsk Oblast (KULIKOV 2005)
71. Kulevchi, Vernensky District, Chelyabinsk Oblast (KULIKOV 2005)
72. Oktyabrsky District, Chelyabinsk Oblast (KULIKOV 2005)
73. Terek-Kuma lowland, Stavropol Krai, generally reported from the region without locality information (ABDURZAKOVA et al. 2013)
74. Chechen Republic, generally reported from the area of Republic (TAYSUMOV 2013)
75. Moskva, generally reported as a weed (MAYEVSKIY 1964)
76. Orekhovo-Zuyevo, Moskva Oblast, sandy areas along the Voksalnaya St. (FEDOROVA 2015)
77. Cheboksary, Chuvashia Republic, besides railway track – 2–5 km from the town towards Kanash (GAFUROVA 2014, obs. Dimitriev, 12.09.1981).
82. Volodymyrivka, Mykolaiv Oblast, roadside (PACZOSKI 2008, obs. 1898)
83. Bereznehuвате, Mykolaiv Oblast, roadside (PACZOSKI 2008, obs. date ?)
84. Donetsk Oblast, noted sporadically or moderately often, not expansive (OSTAPKO et al. 2009)
85. Lugansk Oblast, noted sporadically or moderately often, not expansive (OSTAPKO et al. 2009)
86. Lugansk Nature Reserve Park (KONDRAKYUK et al. 1988)
87. Kehychevka, Kharkiv Oblast, railway embankment near the bridge over the Vshyva river, (photography by D.A. DAVYDOV, 21.07.2011, <http://www.planarium.ru/page/image/id/121334.html>)
88. Gerivka near Poltava, near the road Klymivka-Lisok, sandy areas along the railway track, a new species for the flora of Poltava (HOMLYA & DAVYDOV 2006)
89. Kiev Oblast, generally reported from the region (DANCHENKO 2010)
90. Kharkov (KRYTSKA 1987)
91. Odessa (SCHULZ 1901, obs. since 1820)
92. Krym (YENA 2012).

AZERBAIJAN

78. Ordubat (SCHULZ 1901, BOBROV 1945).

UKRAINE

79. Kherson (BOBROV 1945)
80. Oleksandriivka towards the town of Stanislav, Kherson Oblast, shores of the reservoir on the Boh river (PACZOSKI 2008, obs. date ?)
81. Between the towns of Shestirnya and Szyroke, Dnipropetrovsk Oblast, fields and roadsides (PACZOSKI 2008, obs. 1898/1988)

BELARUS

93. Generally reported as an alien species, rarely occurring at the roadsides and railway grounds in the whole country (PARFENOV 1999)
94. Mozyr, Gomel Oblast, right bank of the Prypeć river, patch of 0.5 × 1 m in area (leg. D.I. Tretyakov, 16.08.1980, MSK)
95. Svetlogorsk District, Gomel Oblast, right bank of the Berezyna river, sporadic occurrence (leg. M. Dzhus, 13.07.1998, MSKU)
96. Polotsk, Vitebsk Oblast, 1 specimen, yard near a glass wool factory (leg. G.V. Vynaev, D.I. Tretyakov, 18.07.1977, MSK)
