(Received: June 28, 2016. Accepted: July 29, 2016)

ABSTRACT. The study presents vascular flora, both spontaneous and that coming from former and contemporary plantings found in five palace parks in the Wielkopolska region. Analyses were conducted in the years 2010–2013. A total of 612 vascular plant species were reported. In terms of the floristic composition the park in Wąsowo was the richest (335 species), while the park in Konarzewo was the poorest (133 species). Interesting plants occurring spontaneously in the analysed area include *Alisma ×rhenocarpum*, *Asperugo procumbens*, *Cardamine flexuosa*, *Cardamine hirsuta*, *Cerastium macrocarpum*, *Geranium molle*, *Monotropa hypophygea*, *Oxalis corniculata*, *Stellaria neglecta* and *Vicia dasycarpa*. The most interesting species grown or probably purposefully introduced to the parks include *Acanthus longifolius*, *Aegopodium podagraria* ‘Variegatum’, *Chaerophyllum aromaticum*, *Corydalis cava*, *Corydalis intermedia*, *Cymbalaria muralis*, *Euphorbia amygdaloides*, *Gagea minima*, *Geranium pyrenaicum*, *Geranium sanguineum*, *Gypsophila paniculata*, *Helianthemum apenninum*, *Isoëpyrum thalictroides*, *Lithospermum purpurocaeruleum*, *Luzula luzuloides*, *Narcissus pseudonarcissus*, *Origanum vulgare*, *Ornithogalum nutans*, *Poa chaixii*, *Rudbeckia fulgida*, *Telekia speciosa* and *Viola cyanea*.

KEY WORDS: palace parks, flora, indices of flora synanthropization, Czerniejewo, Konarzewo, Obrzycko, Śmiełów, Wąsowo, Wielkopolska, Poland

INTRODUCTION

Ornamental gardens were established at mansions in the Wielkopolska region starting from the 16th century. The turn of the 17th and 18th centuries was the period of their greatest development. The layout for first ornamental gardens, called Italian gardens, was based on geometrical figures and comprised compartments, terraces and hedges. These gardens were later replaced by French gardens of a regular arrangement, marked by espaliers, avenues, canals and cascades. English style parks appeared in the Wielkopolska region in the 1st half of the 17th century. Parks formed an inseparable whole with buildings. Their function was to isolate the mansion residents from the village and manor farm buildings, shelter them from winds and provide appropriate walking grounds for strolls. They were marked by an arbitrary arrangement of roads and paths, clusters of trees and shrubs, ponds,

canals, picturesque beauty spots, clearances and vistas. In the 2nd half of the 18th century Romantic parks came into fashion, characterised by picturesque open spaces, beautiful views, canals, ponds, various pavilions, sculptures and monuments. Initially English landscape designs were parts of Romantic parks, but with time the landscape function of parks was becoming increasingly important. Eventually landscape parks became predominant in palace park designs in the Wielkopolska region. Initially park plantings were destroyed and new ones were planted in their place. Only occasionally old plantings were left and the new landscape park was established outside it to constitute a whole. Exotic species of trees, shrubs and herbaceous plants were imported starting from the 19th century (MAJDECKI 2008).

Countryside parks, next to forest complexes, play an important role in Polish landscape. In many regions of the country they provide it with characteris-

Table 1. Characteristics of analysed palace parks

No.	Palace park	Area (ha)	Data of settle	Water	Meadow	Orchard	Actual usage	Source of information
1	Czerniejewo, community Czerniejewo, district Gniezno	13.00	1771–1775	pond	+	+	+	Antkowiak & Wojciechowska (2007)
2	Konarzewo, community Dopiewo, district Poznań	11.74	1689–1699	–	+	–	–	Czekalski (1999)
3	Obrzycko, community Obrzycko, district Szamotuły	19.00	1862	pond and Warta river	+	+	+	–
4	Śmiełów, community Żerków, district Jarocin	14.00	1795–1800	Lutynia river	+	+	+	Czekalski (2012)
5	Wąsowo, community Kuślin, district Nowy Tomyśl	49.50	1780–1786	pond, ditch	+	+	+	Rybarczyk (2014)

tic features and unique charm, always enhancing and supplementing its nature value (DRZAŁ & LESZCZYCKI 1974). Unfortunately, some palace and manor parks were partly devastated in the last century. This was primarily caused by the seizure of these landed properties after the end of WWII in 1945 by the State Treasury and their transformation into various public facilities, e.g. offices of state-owned farms, resorts and orphanages (SKRAJNA 2007, MARKUSZEWSKA 2008, BYKOWSKA 2014). The change of the originally intended use and a lack of tending operations enhanced transformations in the tree stands and vegetation cover leading to more natural plant communities (OLACZEK 1972). In turn, common access to some parks and in some cases their use inconsistent with their original function distorted these communities. Irrespective of the directions in the transformations of park vegetation in many park plantings we may find valuable showy trees of native and introduced species (CZEKALSKI 1978, SENETA 1989) as well as a rich flora of herbaceous species.

Most studies conducted in former manor parks concern their dendroflora (CZEKALSKI 1978, 1999,

2001, 2012, CZEKALSKI & KLIASZEWSKA 2003, SIKORSKI & WYSOCKI 2003, WILBRANDT 2008, KUŁAK & SENDER 2012, KUCHARSKI & CHMIELNICKI 2014, KORSZUN & BYKOWSKA 2015). Only research conducted in recent years has supplied information on herbaceous plants (CZARNA 2007, SKRAJNA 2007, CZARNA et al. 2008, RATYŃSKA et al. 2008, 2009) and bryoflora (RUSIŃSKA 2008) of these interesting and valuable nature objects.

This floristic study concerns five park and palace complexes in the Wielkopolska region located in Czerniejewo, Konarzewo, Obrzycko, Śmiełów and Wąsowo (Fig. 1). Analysed objects were established in the 17th and 18th centuries. They range in area from 12 to 50 hectares. All the park and palace complexes currently represent the English style, although some of them had originally been designed in another style (e.g. the park in Czerniejewo was established in the French style; a part of the garden in Konarzewo was initially designed in the Italian style). The landscape character of these parks is strengthened by the presence of water reservoirs of various types as well as varied vegetation cover (Table 1). The aim of this study was to conduct a detailed survey and valuation of vascular flora, as well as determine the degree of flora synanthropization.

MATERIAL AND METHODS

Floristic studies were conducted in the years 2010–2013. Species were recorded twice: in the spring and summer. Species nomenclature was adopted after MIREK et al. (2002), as well as ERHARDT et al. (2008) and GAWRYŚ (2008). Each species was evaluated according to the five-point frequency scale: 1 – very rare – scarce specimens; 2 – rare – relatively numerous specimens cover up to 5% park area; 3 – moderately frequent – numerous specimens cover 5–25% of the area; 4 – frequent – abundant specimens cover 25–50% of the area; 5 – very frequent (common) – abundant specimens cover over 50% of the area.

Analysis of flora comprised a characteristic of their life forms according to Raunkiaer after ERHARDT (2008), as well as ZARZYCKI et al. (2002) and RUTKOWSKI (2004). The geographical-historical spectrum

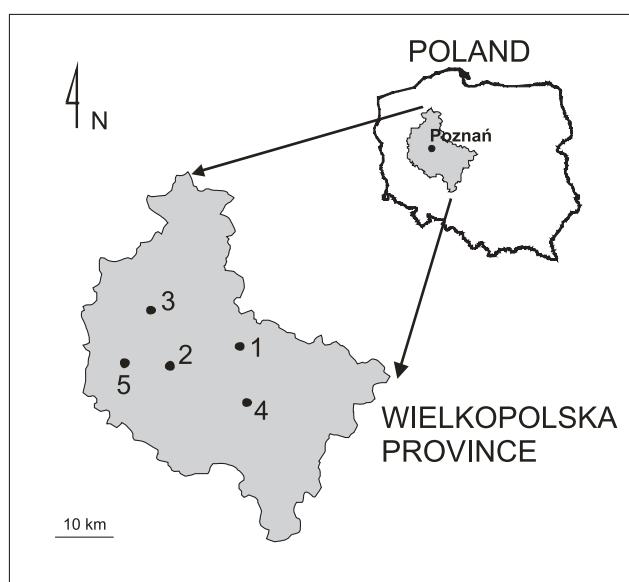

Fig. 1. Localization of analysed palace parks: 1 – Czerniejewo; 2 – Konarzewo; 3 – Obrzycko; 4 – Śmiełów; 5 – Wąsowo

was based on a study by RUTKOWSKI (2004) and CZARNA (2009). Protected species were verified based on the Regulation of the Minister of the Environment of 9 October 2014 (ROZPORZĄDZENIE... 2014). Based on the Red lists and books the status of species endangerment was established on the regional (JACKOWIAK et al. 2007) and the national levels (KAŽMIERCZAKOWA & ZARZYCKI 2001, ZARZYCKI & MIREK 2006). Dynamic trends for alien species were established after TOKARSKA-GUZIK et al. (2012). Coefficients of flora synanthropization were determined after JACKOWIAK (1990). They represent the percentage contribution of specific geographical-historical groups and were calculated with reference to the entire analysed flora. A list of formulas is given below. Used abbreviations mean: Sp – spontaneophytes; Ap – apophytes; Ar – archeophytes; Kn – kenophytes; ErW – ergasiophytes spreading vegetatively; ErgG – ergasiophytes spreading generatively; Ef – ephemeralophytes; N – the total species number.

The total synanthropization index specifies the share of synanthropic spontaneophytes in the entire flora: $WS_c (\%) = (Ap + Ar + Kn + Ef)/N$; the permanent synanthropization index specifies the share of apophytes and established alien species in the permanent segment of flora: $WS_t (\%) = (Ap + Ar + Kn + ErW + ErG)/(Sp + Ap + Ar + Kn + ErW + ErG)$.

The total apophytism index specifies the share of apophytes in the total flora: $WA_p_c (\%) = Ap/N$; the permanent apophytism index represents the share of apophytes in the permanent segment of flora: $WA_p_t (\%) = Ap/(Sp + Ap + Ar + Kn + ErW + ErG)$.

The total anthropophytism index specifies the share of alien species in the entire flora: $WA_n_c (\%) = Ar + Kn + Ef + ErG + ErW + E0/N$; the permanent anthropophytism index represents the share of established alien species in the permanent segment of flora: $WA_n_t (\%) = Ar + Kn + ErW + ErG / (Sp + Ap + Ar + Kn)$.

The total archeophytism index specifies the share of archeophytes in the total flora: $WA_r_c (\%) = Ar/N$; the permanent archeophytism index represents the percentage of archeophytes in the permanent segment of flora: $WA_r_t (\%) = Ar/(Sp + Ap + Ar + Kn + ErW + ErG)$.

The total kenophytism index specifies the share of kenophytes in the total flora: $WK_n_c (\%) = Kn/N$; the permanent kenophytism index gives the share of kenophytes in the permanent segment of flora: $WK_n_t (\%) = Kn/(Sp + Ap + Ar + Kn + ErW + ErG)$.

The index of flora modernization specifies the share of kenophytes in the flora of permanently established alien species: $WM (\%) = Kn/(Kn + Ar + ErG + ErW)$.

The flora fluctuation index defines the share of ephemeralophytes in the total flora: $WF (\%) = Ef/N$.

The apophytism index for spontaneophytes specifies the percentage share of apophytes in the entire group of native species $Wap (\%) = Ap/(Sp + Ap)$.

Herbarium sheets were deposited at the Herbarium of the Poznań University of Life Sciences (POZN).

RESULTS

In the five palace parks a total of 612 vascular species were recorded. In the tree layer there were 71 species, in the shrub layer there were 120, while in the herbaceous layer there were 466 species, respectively (Table 2). The largest numbers of species were reported in the parks of Wąsowo (335) and Obrzycko (327), while the numbers were smallest in the parks in Konarzewo (133) and Śmiełowo (183). In the park in Czerniejewo a total of 268 species were recorded (Table 3).

In all the analysed parks very rare and rare species predominated markedly (Table 4). *Carpinus betulus* was a common species in the park in Czerniejewo. *Anemone nemorosa* and *Fagus sylvatica* are frequent species in Wąsowo.

Vascular plants in the palace parks are represented by 10 life forms (Table 5). Among life forms in all the parks the largest group was composed of hemicyclopophytes (241 species), followed by megaphanerophytes (90) and annual plants (80). Interesting findings are the relatively large share of geophytes (63 species), as well as nanophanerophytes (68 species). Among geophytes a considerable share is reported for spring plants such as *Adoxa moschatellina*, *Allium ursinum*, *Anemone nemorosa*, *A. ranunculoides*, *Convallaria majalis*, *Corydalis cava*, *C. intermedia*, *Ficaria verna*, *Gagea arvensis*, *G. lutea*, *G. minima*, *G. pratensis*, *Galanthus nivalis*, *Isopyrum thalictroides*, *Lathraea squamaria*, *Lilium regale*, *Maianthemum bifolium*, *Muscari botrys*, *Narcissus pseudonarcissus*, *Ornithogalum nutans*, *O. umbellatum*, *Paris quadrifolia*, *Petasites hybridus*, *Polygonatum multiflorum*, *Scilla sibirica* and *Tulipa fosteriana*.

Native plants (spontaneophytes and apophytes) account for almost 60% all species (Table 6). Depending on the park the share of these species ranged from 72 (the park in Konarzewo) to 241 (the park in Wąsowo). Among apophytes the following species were found in all the parks: *Acer platanoides*, *Aegopodium podagraria*, *Anemone nemorosa*, *Anthriscus sylvestris*, *Bellis perennis*, *Chaerophyllum temulum*, *Corylus avellana*, *Dactylis glomerata*, *Dryopteris filix-mas*, *Euonymus europaea*, *Fagus sylvatica*, *Fraxinus excelsior*, *Geum urbanum*, *Hedera helix*, *Lapsana communis*, *Plantago lanceolata*, *P. major*, *Poa nemoralis*, *Potentilla repens*, *Ranunculus repens*, *Rumex obtusifolia*, *Sambucus nigra*, *Sorbus aucuparia*, *Stellaria media*, *Taraxacum officinale*, *Veronica chamaedrys* and *V. sublobata*. Among alien species the most numerously represented are ergasiophytes (144 species), followed by kenophytes (56) and archeophytes (46). Only one species, *Lycopersicum esculentum*, represented ephemeralophytes. In the group of alien species there were taxa with marked invasive tendencies. Seven-

Explanations:

Cz – Czerniejewo, K – Konarzewo, O – Obrzycko, Ś – Śmiełów, W – Wąsowo; cul – species introduced to cultivation.

Frequency classes: 1 – very rare; 2 – rare; 3 – moderately frequent, rare; 4 – frequent; 5 – very frequent (common).

LF (life forms): M – megaphanerophyte; N – nanophanerophyte; Ch – chamaephyte; G – geophyte; H – hemicryptophyte; Hel – helophyte; Hyd – hydrophyte; T0 – annual plant not producing seeds; T1 – annual plant; T2 – biennial plant; Li – liana.

GHg (geographical-historical groups): Sp – spontaneophyte; Ap – apophyte; Ar – archeophyte; Kn – kenophyte; ErW – ergasiophyte spreading vegetatively; ErgG – ergasiophyte spreading generatively; Er0 – ergasiophyte not wintering; Ef – ephemeralophyte.

Table 3. Number of species in analysed palace parks

Palace park	All species	Species in the particular layer			Cultivated species
		trees	shrubs	herbaceous	
Czerniejewo	268	46	51	189	83
Konarzewo	133	25	33	79	66
Obrzycko	327	37	54	250	125
Śmieleń	183	30	49	114	109
Wąsowo	335	36	39	263	81

Table 4. Number of species in individual frequency classes.
For species found in several classes the highest frequency class is given

	Czerniejewo	Konarzewo	Obrzycko	Śmieleń	Wąsowo
1	138	77	209	173	317
2	108	47	97	10	14

5	1	0	0	0	0
Total	268	133	327	183	335

For abbreviations see Table 2.

teen of the reported species are invasive species on the national scale (*Acer negundo*, *Amaranthus retroflexus*, *Bidens frondosa*, *Bromus carinatus*, *Conyza canadensis*, *Echinochloa crus-galli*, *Echinocystis lobata*, *Erigeron annuus*, *Galinsoga ciliata*, *G. parviflora*, *Impatiens parviflora*, *Oxalis fontana*, *Prunus serotina*, *Quercus rubra*, *Robinia pseudoacacia*, *Setaria viridis*, *Solidago canadensis*). Seven species are invasive on the regional scale: *Ailanthus altissima*, *Amelanchier spicata*, *Clematis vitalba*, *Epilobium ciliatum*, *Juglans regia*, *Lolium multiflorum*, *Lycium barbarum*. Five of the recorded alien established species are

recessing species – *Aethusa cynapium*, *Anthriscus cerefolium*, *Gagea arvensis*, *Veronica opaca*, *Veronica polita*.

Cultivated plants included also species covered by strict species protection (*Iris sibirica*, *Primula vulgaris*) and species covered by partial protection (*Allium ursinum*, *Aruncus sylvestris*, *Epipactis helleborine*, *Gallanthus nivalis* and *Taxus baccata*). Protected species were found in all the analysed park plantings. The greatest numbers of protected species were reported in the park in Obrzycko (6), while the number was smallest in Konarzewo (1).

The following indices of synanthropization were obtained for the flora in the investigated parks: $WS_c = 82.01\%$, $WS_t = 81.86\%$, $WAp_c = 40.92\%$, $WAp_t = 41.26\%$, $WAn_c = 41.09\%$, $WAn_t = 53.16\%$, $WAR_c = 7.59\%$, $WAR_t = 7.65\%$, $WKn_c = 9.24\%$, $WKn_t = 9.32\%$, $WM = 22.95\%$, $WF = 0.16\%$, $Wap = 69.47\%$. Palace parks, created by man and subjected to human intervention, are characterised by high indices of synanthropization of the flora (WS_c and WS_t). These objects, particularly intensively managed two centuries earlier, have retained a relatively high percentage of old introduced species ($WAR_c = 7.59\%$), while the share of transitionally established anthropophytes is relatively small ($WF = 0.16\%$).

DISCUSSION

The analysed park and palace complexes serve a significant role as refuges of native species. Almost 60% species recorded in the five parks are apophytes and spontaneophytes. Among native plants found in these palace parks forest plants are represented in large numbers, e.g. *Aegopodium podagraria*, *Ajuga reptans*, *Allium ursinum*, *Anemone nemorosa*, *Anemone ranunculoides*, *Aquilegia vulgaris*, *Betonica officinalis*, *Campanula trachelium*, *Chaerophyllum aromaticum*, *Convallaria majalis*, *Corydalis cava*, *C. intermedia*, *Corylus avellana*, *Fragaria moschata*, *Gagea lutea*, *G. minima*, *Galanthus nivalis*, *Galeobdolon luteum*, *Galium odoratum*, *Hedera helix*, *Hepatica nobilis*, *Isopyrum thalictroides*, *Lamium maculatum*, *Luzula luzuloides*, *Lysimachia nummularia*, *Matteucia struthiopteris*, *Melica uniflora*, *Poa chaixii*, *Polygonatum multiflorum*, *Ranunculus lanuginosus*, *Taxus baccata*. Some of the recorded forest species probably come from fragments of forests, on the basis of which the parks were established. Another very important group of forest plant species comprises those, which were probably purposefully transferred from natural localities in order to enhance the value of these parks. In the past it was a common practice to transfer showy plants from their natural locality to parks (LATOWSKI & ZIELIŃSKI 2001). Sometimes showy specimens from non-forest communities were also transferred to parks. In the investigated parks this group of plants is formed by *Aruncus sylvestris*, *Berberis vulgaris*, *Campanula rapunculoides*, *Gagea pratensis*, *Geranium sanguineum*, *Gypsophilla paniculata*, *Iris sibirica*, *Juniperus communis*, *Myosotis sparsiflora*, *Myosotis sylvatica*, *Origanum vulgare*, *Petasites hybridus*, *Pinus mugo*, *Rosa gallica*, *Sanguisorba officinalis*, *Viburnum opulus*. Floristic studies of former manor parks indicate that natural habitats, from which the plants were collected, were not always situated in the close vicinity of the parks. Occasionally the species were transferred from distant regions of Poland. Native species in Poland, but not found spontaneously in the Wielkopolska region, recorded in the analysed parks definitely include *Euphorbia amygdaloides*, *Galanthus nivalis*,

Gypsophila paniculata, *Lithospermum purpurocaeruleum*, *Luzula luzuloides*, *Matteucia struthiopteris*, *Myosotis sylvatica*, *Petasites hybridus*, *Pinus mugo*, *Poa chaixii*, *Taxus baccata*. According to LATOWSKI & ZIELIŃSKI (2001), establishment of new anthropogenic localities for native plants resulted in the transformation of their ranges and frequently plants growing in an apparently natural locality may constitute a genetically alien element in a given area. In turn, SZWED et al. (2008) were of an opinion that the role of parks as refuges of native plants is eliminated in a situation when genotypes of local species are modified as a result of the introduction of genetically alien plants.

Parks, as open systems, may be locations for the establishment of species originating from neighbouring ecosystems. The species escaping from vegetable gardens and established in the parks include the following plants with culinary value: *Allium scorodoprasum*, *Anthriscus cerefolium* and *Chaerophyllum aromaticum*. Among interesting kenophytes we need to mention *Geranium pyrenaicum*, *Viola cyanea* and *V. odorata*.

In the investigated parks we may definitely observe a considerable share of hemicryptophytes. The dominance of this life form of plants over the others is typical of Poland (JACKOWIAK 2001). A large share of hemicryptophytes results from the landscape character of the parks, in which habitats exhibit considerable stability and localities resemble natural plant communities. Among geophytes native, typically forest species, are represented in large numbers, as plants which flower before full foliage appears on trees. The occurrence of geophytes flowering in early spring in the opinion of RATYŃSKA et al. (2008) is a typical characteristic of former manor parks, since they were usually purposefully introduced by man.
