## MAIN INNOVATION INDICATORS IN POLAND AND GERMANY

### GŁÓWNE WSKAŹNIKI INNOWACJI W POLSCE I W NIEMCZECH

Katedra Zastosowań Matematyki w Ekonomii, Zachodniopomorski Uniwersytet Technologiczny w Szczecinie  
ul. Janickiego 31, 71-270 Szczecin, e-mail: jmiklewska@gmail.com

**Abstract.** Author presents main innovation indicators in selected agglomerations and regions in Poland and Germany. These figures describe gap between regions and the state of knowledge-based economy. At present, less than 2% of Europe's wealth (GDP) is devoted to research, which compares poorly with 2.5% in the USA and more than 3% in Japan. Our goal is to approach 3% of GDP for research. This is an important part of the so-called "Lisbon strategy", which consists of a Partnership between the European Union and Member States to transform Europe in a vibrant knowledge economy, in order to boost economic growth, create more and better jobs and ensure lasting prosperity in Europe.

**Key words:** agglomeration, European Union, innovation index, innovation indicator, region.

**Słowa kluczowe:** aglomeracja, indeks innowacji, region, Unia Europejska, wskaźnik innowacji.

## INTRODUCTION

European Commission introduced EIS – The European Innovation Scoreboard (Fig. 1). EIS covers the 27 EU Member States, Croatia and Turkey, the associate countries Iceland, Norway and Switzerland, as well as Australia, Canada, Israel, Japan and the US. The indicators of the EIS summarize the main elements of innovation performance. The EIS 2007 fully implements the list of indicators from the EIS 2006. The innovation indicators are assigned to five dimensions and grouped in two main themes: inputs and outputs. Table 1 shows the 5 main categories, the 25 indicators, and the primary data sources for each indicator. Innovation inputs cover three innovation dimensions: *Innovation drivers* measure the structural conditions required for innovation potential; *Knowledge creation* measures the investments in R&D activities, considered as key elements for a successful knowledge-based economy; and *Innovation & entrepreneurship* measures the efforts towards innovation at firm level. Innovation outputs cover two innovation dimensions: *Applications* measures the performance, expressed in terms of labour and business activities, and their value added in innovative sectors; and *Intellectual property* measures the achieved results in terms of successful know-how.

## MATERIAL AND METHODS

The EIS country pages provide for selected European countries covered by the EIS 2007 a performance chart showing performance by indicator relative to the EU mean (Fig. 2), a radar graph showing the innovation performance for each of the innovation dimensions relative to the country's SII performance (Fig. 3) and the data tables showing, where available, time series data for the SII, the dimensions and each of the indicators (Tab. 2, Tab. 3).

Table 1. The Structure of EIS 2007. Input and Output Dimensions and Data Sources

INNOVATION DRIVERS (INPUT DIMENSION)		
1.1	S&E graduates per 1000 population aged 20–29	Eurostat
1.2	Population with tertiary education per 100 population aged 25–64	Eurostat, OECD
1.3	Broadband penetration rate (number of broadband lines per 100 population)	Eurostat, OECD
1.4	Participation in life-long learning per 100 population aged 25–64	Eurostat
1.5	Youth education attainment level (% of population aged 20–24 having completed at least upper secondary education)	Eurostat
KNOWLEDGE CREATION (INPUT DIMENSION)		
2.1	Public R&D expenditures (% of GDP)	Eurostat, OECD
2.2	Business R&D expenditures (% of GDP)	Eurostat, OECD
2.3	Share of medium-high-tech and high-tech R&D (% of manufacturing R&D expenditures)	Eurostat, OECD
2.4	Share of enterprises receiving public funding for innovation	Eurostat (CIS4)
INNOVATION & ENTREPRENEURSHIP (INPUT DIMENSION)		
3.1	SMEs innovating in-house (% of all SMEs)	Eurostat (CIS4)
3.2	Innovative SMEs co-operating with others (% of all SMEs)	Eurostat (CIS4)
3.3	Innovation expenditures (% of total turnover)	Eurostat (CIS4)
3.4	Early-stage venture capital (% of GDP)	Eurostat
3.5	ICT expenditures (% of GDP)	Eurostat, World Bank
3.6	SMEs using organisational innovation (% of all SMEs)	Eurostat (CIS4)
APPLICATIONS (OUTPUT DIMENSION)		
4.1	Employment in high-tech services (% of total workforce)	Eurostat
4.2	Exports of high technology products as a share of total exports	Eurostat
4.3	Sales of new-to-market products (% of total turnover)	Eurostat (CIS4)
4.4	Sales of new-to-firm products (% of total turnover)	Eurostat (CIS4)
4.5	Employment in medium-high and high-tech manufacturing (% of total workforce)	Eurostat, OECD
INTELLECTUAL PROPERTY (OUTPUT DIMENSION)		
5.1	EPO patents per million population	Eurostat, OECD
5.2	USPTO patents per million population	Eurostat, OECD
5.3	Triad patents per million population	Eurostat, OECD
5.4	New community trademarks per million population	OHIM, Eurostat, OECD
5.5	New community designs per million population	OHIM, Eurostat, OECD

Source: European innovation... (2008).

Stuttgart and Berlin regions are “Knowledge and learning regions”. In 2006 in the EU27, 12 million workers were employed in medium high-tech manufacturing<sup>4</sup> and 2.3 million in hightech manufacturing<sup>4</sup>, the equivalent of 5.5% and 1.1% respectively of total employment.

The leading region in the EU27 and EFTA in terms of employment in high- and medium high-tech manufacturing was Lombardia in Italy with 448 000 people employed in 2006, followed by Stuttgart in Germany (377 000) and Cataluña in Spain (286 000). Germany dominated the top 20 list with eleven regions, followed by Italy (5) and France (2).

Stuttgart had the highest relative employment in high- and medium high-tech manufacturing with 19.9% of total employment, followed by Karlsruhe (17.2%) also in Germany. In the top 20 list, Germany had eleven regions, including the eight highest positions, followed by the Czech Republic (4), France and Hungary (2 each).

## RESULTS AND DISCUSSION

Author selects following regions: Germany, Baden-Württemberg, Stuttgart, Berlin, Mecklenburg-Vorpommern, Euro area, European Union 15, European Union 27, Poland, Małopolskie, Wielkopolskie, Zachodniopomorskie and investigates following indicators:

1. Total intramural R&D expenditure (GERD) by sectors of performance and region – Percentage of GDP (Tab. 4).
2. Total intramural R&D expenditure (GERD) by sectors of performance and region – Total (Millions of euro (from 1.1.1999)/Millions of ECU (up to 31.12.1998)) (Tab. 5).
3. Total intramural R&D expenditure (GERD) by sectors of performance and region – Business enterprise sector, Percentage of GDP (Tab. 6).
4. Total intramural R&D expenditure (GERD) by sectors of performance and region – Business enterprise sector, Millions of euro (from 1.1.1999)/Millions of ECU (up to 31.12.1998) (Tab. 7).
5. Total intramural R&D expenditure (GERD) by sectors of performance and region – Higher education sector, Percentage of GDP (Tab. 8).
6. Total intramural R&D expenditure (GERD) by sectors of performance and region – Higher education sector, Millions of euro (from 1.1.1999)/Millions of ECU (up to 31.12.1998) (Tab. 9).

## CONCLUSIONS

On the basis of author's research projects (International research...2008) author describes below comparison between Poland and Germany.

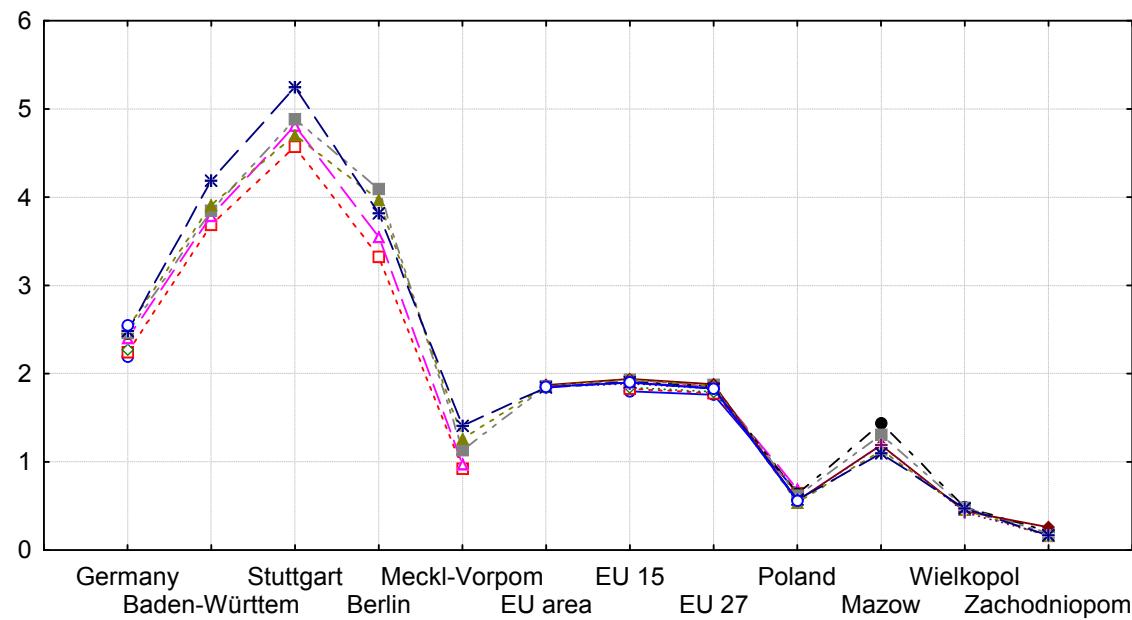

Poland's innovation performance has increased relative to the EU average trend over the past five years. If current trends continue it would reach the EU average level of performance within twenty years. Over the past five years, the trend in Germany's overall performance has been about the same as the EU average trend.

Poland has a level of innovation performance that places it in the group of "catching up countries". Other EU countries in this group with similar overall levels of performance are Malta, Lithuania, Hungary, Greece, Slovakia, Portugal, Bulgaria, Latvia and Romania. Germany's overall innovation performance places it among the group of "innovation leaders". Other EU countries in this group are Sweden, which shows the highest level of innovation performance, and Finland, Denmark and the UK.

Poland has a relatively even level of performance across the five dimensions of innovation. It shows relative strengths in the indicators of Youth education attainment level, ICT expenditures, and Sales of new-to-market products. It is well below the EU average on the indicators of Business R&D expenditures, Early-stage venture capital, and patenting activities. Germany shows relative strengths in the Applications and Intellectual Property dimensions of innovation performance, where it has a particularly strong performance on the indicators of Sales of new to market products, Medium-high/high-tech manufacturing employment as well as a high level on the indicators of patenting. However, it is below the EU average in the Innovation drivers dimension, where it is behind the EU average on indicators of S&E graduates, participation in life-long learning and youth education attainment level.

The analysis indicates that Poland is below average in its efficiency of transforming innovation inputs into outputs. Germany shows one of the highest efficiencies in the EU in terms of transforming innovation inputs into outputs.

Sweden, Finland, Denmark, Germany and UK are the most innovative EU countries and ahead of the US. Based on their innovation performance, the countries included in the EIS 2007 fall into the following country groups:

1. The innovation leaders include Denmark, Finland, Germany, Israel, Japan, Sweden, Switzerland, the UK and the US. Sweden is the most innovative country, largely due to strong innovation inputs although it is less efficient than some other countries in transforming these into innovation outputs.
2. The innovation followers include Austria, Belgium, Canada, France, Iceland, Ireland, Luxembourg and the Netherlands.
3. The moderate innovators include Australia, Cyprus, Czech Republic, Estonia, Italy, Norway, Slovenia and Spain.
4. The catching-up countries include Bulgaria, Croatia, Greece, Hungary, Latvia, Lithuania, Malta, Poland, Portugal, Romania and Slovakia. Turkey currently performs below the other countries.

These country groups appear to have been relatively stable over the last five years. Within these groups, countries have changed their relative ranking but it is rare for a country to have moved between groups. Only Luxembourg seems to be on the verge of entering the group of innovation leaders. Czech Republic, Estonia and Lithuania are on track to reach the EU average within a decade.

**Streszczenie.** W artykule przedstawiono główne wskaźniki innowacyjności dla wybranych aglomeracji i regionów Polski i Niemiec. Tabele i rysunki ukazują istniejącą lukę między badanymi regionami oraz stan tzw. ekonomii opartej na wiedzy (GOW). Obecnie w Europie na badania przeznacza się mniej niż 2% PKB. Prezentuje się to bardzo skromnie w porównaniu z kwotami, które przeznacza się w USA (2,5%) i w Japonii (3%). Naszym celem jest zbliżenie się do poziomu 3%. Jest to ważna część tzw. Strategii lizbońskiej, która zakłada partnerstwo między Unią Europejską i krajami członkowskimi, mające doprowadzić do szybkiego rozwoju GOW w celu połączenia ekonomicznego wzrostu, tworzenia większej liczby lepszych miejsc pracy oraz podtrzymywania dochodu w Europie.
